SKILLS

EDUCATION

Certificate in Web Development
React.js & Next.js Specialization
EarlyCode Institute
2024 – 2025

BROWN AD. OZIOMACHI

FULL-STACK DEVELOPER — REACT.JS / NEXT.JS / FIREBASE

PROFILE

- Full-stack developer who designs, builds, and ships production web platforms end-to-end — from payment architecture to SEO infrastructure.
- Founder and lead engineer of a pan-African academic marketplace operating across 30+ countries, and of a content platform with its own monetization system.
- Specializes in Next.js/React front ends backed by secure, idempotent Firebase architectures.

CAREER

Founder & Full-Stack Developer — Pan-African Academic Document Marketplace

2024 – Present

- Designed and built a marketplace serving students, lecturers, and independent authors across 30+ African countries, including a global multi-currency conversion system so pricing and payouts work natively in each local currency.
- Led a full architectural migration of every financial operation — transaction logging, book-access grants, seller wallet credits, referral payouts, and email notifications — from client-side writes into a secured backend webhook layer built on the Firebase Admin SDK with idempotency guarantees.
- Integrated the Flutterwave payment gateway end-to-end and hardened the surrounding payment stack to enforce a strict rule: the frontend never performs direct financial writes.
- Built an Academic Bounty Board feature from the ground up — escrow service, bounty notifications, PDF/Google-Drive fulfillment flow, per-bidder dispute handling, and role-based access — adding a new peer-to-peer revenue channel.
- Shipped seller-facing monetization tools including Print Licensing Control, a Premium Advertising / Boost Visibility system with admin approval, and a Page Traffic Analytics dashboard with ad-tier recommendations, plus an admin panel with real-time Firestore listeners.
- Identified and remediated a critical Next.js authorization bypass (CVE-2025-29927) and resolved recurring Firestore permission failures via security-rule audits.

Founder & Full-Stack Developer — Brown Code (Portfolio & Blog Platform)

2024 – Present

- Built and maintain a Next.js/Firebase content platform, converting the core article page from a client to a server component with generateMetadata to strengthen SEO and page-load performance.
- Ran a full technical SEO rollout — sitemap submission to Google, Bing, and Yandex, IndexNow configuration, and a custom meta-data lookup system supplying optimized titles and descriptions across the entire article catalog.
- Designed a sponsored-article advertising product with a tiered pricing model (₦25,000 / ₦60,000 / ₦100,000 for 1/3/6-month placements) and a real-time indexing-status dashboard, creating a direct monetization stream.
- Built Node.js automation tooling to auto-watermark published images, and engineered a dynamic blog category system with a manually curated taxonomy across the full article set.

Freelance Full-Stack Developer — Independent / Client Web Development Studio

2024 – Present

- Design and build custom web systems for clients across Nigeria on a Next.js/Firebase stack, owning each project independently from architecture and scoping through deployment and handover.
